General Description

The ADG1633 and ADG1634 are monolithic industrial CMOS(iCMOS®) analog switches comprising three independentlyselectable single-pole, double-throw (SPDT) switches andfour independently selectable SPDT switches, respectively.

All channels exhibit break-before-make switching action thatprevents momentary shorting when switching channels. AnEN input on the ADG1633 (LFCSP and TSSOP packages) andADG1634 (LFCSP package only) is used to enable or disablethe devices. When disabled, all channels are switched off.

The ultralow on resistance and on-resistance flatness of theseswitches make them ideal solutions for data acquisition and gainswitching applications, where low distortion is critical. iCMOSconstruction ensures ultralow power dissipation, making the partsideally suited for portable and battery-powered instruments.

Features

4.5 Ω typical on-resistance

1 Ω on-resistance flatness

Up to 206 mA continuous current

3.3 V to 16 V single-supply operation

No VL supply required

3 V logic-compatible inputs

Rail-to-rail operation

16-lead TSSOP and 16-lead, 3 mm \times 3 mm LFCSP

Application

Communication systems

Medical systems

Audio signal routing

Video signal routing

Automatic test equipment

Data acquisition systems

Battery-powered systems

Sample-and-hold systems

Relay replacements
